

# What is Bio Dentaplast?

Bio Dentaplast is a technopolymer material based on polyoxy methylene. Thanks to its high crystallinity, Bio Dentaplast features excellent material properties (the higher the crystallinity in a resin, the harder the resin will be).

The exceptional physiological behavior and the wide range of mechanical characteristics permit the use in numerous areas of dental prosthesis.

## Clinical indications

- Esthetic clasps
- Postoperative spacers or so-called clamp dentures
- Partial dentures, metal-free clasp restorations

- Supporting structures, frameworks for temporaries
- Tooth-colored appliances(splints)

### **Contraindication**

- Denture bases
- Implant abutments
- Root posts, crowns and bridges (cemented)
